

Triangle: A figure formed by three line segments that connect three noncollinear points.

$\triangle ABC$

$\angle ABC$

Plane ABC

Apr 22-9:20 PM

You can classify a triangle in 2 ways:

1. Angles
2. Sides

Apr 22-9:29 PM

Classifying Triangles by Sides

| | | |
|---|---|--|
| <p>Scalene Triangle</p> <p>no congruent sides</p> | <p>Isosceles Triangle</p> <p>at least 2 congruent sides</p> | <p>Equilateral Triangle</p> <p>3 congruent sides</p> |
|---|---|--|

Classifying Triangles by Angles

| | | | |
|---|--|--|---|
| <p>Acute Triangle</p> <p>3 acute angles</p> | <p>Right Triangle</p> <p>1 right angle</p> | <p>Obtuse Triangle</p> <p>1 obtuse angle</p> | <p>Equiangular Triangle</p> <p>3 congruent angles</p> |
|---|--|--|---|

Jan 19-3:57 PM

Example 1: Classify each triangle by angles and sides

a)
 isosceles right

b)
 equilateral equiangular

Apr 22-9:46 PM

Example 2: ALGEBRA Find x , JM , MN , and JN if $\triangle JMN$ is an isosceles triangle with $\overline{JM} \cong \overline{MN}$.

$$\begin{aligned} 2x-5 &= 3x-9 \\ -5 &= x-9 \\ +9 & \quad +9 \\ \hline 4 &= x \end{aligned}$$

Dec 9-3:53 PM

Example 3: ALGEBRA Find x , QR , RS , and QS if $\triangle QRS$ is an equilateral triangle.

$$\begin{aligned} 4x &= 2x+1 \\ 2x &= 1 \\ x &= 1/2 \end{aligned}$$

Dec 9-3:53 PM

Example 4: Find the measure of each side of the triangle and then classify the triangle by its sides.

ISOSCELES

$$CD = \sqrt{(3-2)^2 + (9-2)^2}$$

$$= \sqrt{1^2 + 7^2}$$

$$= \sqrt{1+49} = \sqrt{50} = 7.07$$

$$CE = \sqrt{(-5-2)^2 + (3-2)^2}$$

$$= \sqrt{7^2 + 1^2}$$

$$= \sqrt{49+1} = \sqrt{50} = 7.07$$

$$ED = \sqrt{(3-5)^2 + (9-3)^2}$$

$$= \sqrt{8^2 + 6^2}$$

$$= \sqrt{64+36} = \sqrt{100} = 10$$

$m = \frac{1}{7}$
 $m = -7/1$

Dec 9-3:53 PM

Triangle Sum Theorem: The sum of the measures of the interior angles in a triangle is 180.

Jan 20-7:42 AM

Example 1: Find the missing angles in each triangle.

40°
47°
?
40
+ 47
= 87
180
- 87
= 93

Dec 9-2:14 PM

180 = 2x + 39

180
- 39
= 141
141 ÷ 2 = 70.5°

Dec 9-2:15 PM

Corollary to the Triangle Exterior Angle Theorem:
The acute angles of a right triangle are **complementary**.

Jan 23-12:43 PM

Example 6: Solve for x.

$2x + x - 6 = 90$
 $3x - 6 = 90$
 $3x = 96$
 $x = 32$

$2x + x - 6 + 90 = 180$

Jan 20-7:43 AM

Exterior Angle of a Triangle: an angle formed by extending one of the sides of the triangle.

Remote Interior Angle of a Triangle: The two angles that are NOT next to the exterior angle.

Dec 9-2:17 PM

Triangle Exterior Angle Theorem: The measure of an exterior angle of a triangle is equal to the sum of the two remote interior angles.

$$m\angle 2 + m\angle 3 = m\angle 1$$

Dec 9-2:17 PM

Example 7: Find the missing angle measures.

Dec 9-2:19 PM

Example 8: Solve for x and find the m∠1.

$$\begin{aligned} 3x + 40 &= 5x - 10 \\ 40 &= 2x \\ 50 &= 2x \\ 25 &= x \end{aligned}$$

Jan 20-7:47 AM
